

Semi In-ground Pool Installation into a Sloped Yard

A semi in-ground pool installation and equipment in a sloped yard application can only be quoted after a site inspection.

The site inspection will determine the following things:

- The location of the filter system
(to be able to supply a self-priming of a gravity fed pump)
- The location of the ladder or step
(to supply the correct in-ground or above ground unit)
- The type of coping needed for the pool
(if the pool will need all concrete/deck receiver, or synthetic wood top rail)

Once the site inspection is complete and the installer gives the information to the store associate, a custom bid for you yard's application will be created. Our goal is to have all bids within 24-48 hours of the site inspection.

To make an educated guess at a price, compare the same size pool's in-ground and above ground price. The semi in-ground price will fall in between those two numbers.
